

1 FindBack Testing Report

Project: FindBack — Campus Lost & Found

Student: Samuel Ntim (22425698)

Course: CSCD602: Advanced Software Engineering

Test environment: Local managed development environment, Chromium responsive previews, MySQL-compatible managed database

Date: 14 August 2026

Live application: <https://campus-property-recovery-ug-edu-gh.manus.space/>

Administrator workspace: <https://campus-property-recovery-ug-edu-gh.manus.space/admin>

Source repository: https://github.com/sntim/campus-lost-found_22425698

1.1 Test Strategy

Testing combines automated unit and authorization tests, production-build validation, responsive interface inspection, and a manual acceptance-test checklist. Automated results are recorded only where they were actually executed. The manual checks must be completed with the student's own live deployment before final submission; they are intentionally marked **Not yet executed** rather than represented as completed.

1.2 Executed Automated Tests

Test area	Evidence	Actual result	Status
Exact item-status rule	server/domainRules.test verifies the exact list: lost, found, resolved, archived.	Passed.	Pass
Contact-disclosure rule	server/domainRules.test verifies that only an administrator or an approved claimant can reveal reporter contact details.	Passed.	Pass
Claim eligibility	server/domainRules.test verifies that only active found reports may receive claims.	Passed.	Pass
Authentication	server/auth.logout.test verifies session- cookie clearing and success response.	Passed.	Pass
Student protection	server/accessControl.test verifies that an anonymous visitor	Passed.	Pass

Test area	Evidence	Actual result	Status
	cannot create a report.		
Administrator protection	server/accessControl.test verifies that a student cannot change an item status.	Passed.	Pass
Test suite execution	pnpm test	5 test files and 11 tests passed.	Pass
Production build	pnpm build	Client bundle and server bundle completed successfully.	Pass

1.3 Responsive System Test Evidence

Scenario	Expected result	Actual result	Status
Mobile browse page	Filter controls stack cleanly, with an understandable empty state.	Verified through 375 × 812 responsive preview.	Pass
Mobile reporting form	Required inputs, image attachment area, and controls remain usable without horizontal overflow.	Verified through 375 × 812 responsive preview.	Pass
Mobile profile	User report/claim/notification areas stack cleanly and retain empty states.	Verified through 375 × 812 responsive preview.	Pass
Mobile admin workspace	Navigation, overview cards and management controls remain readable on narrow screens.	Verified through 375 × 812 responsive preview.	Pass
Unknown item detail route	A missing item produces a safe not-	Server returned an explicit NOT_FOUND result for /	Pass

Scenario	Expected result	Actual result	Status
	found path rather than exposing data.	items/1; loading guard displayed first.	

1.4 Manual Functional and Acceptance Tests to Execute on the Live Deployment

ID	Test case	Expected result	Actual result	Status
TC-01	Sign in as a student.	Profile is available; admin dashboard remains unavailable.	[Record after live test]	Not yet executed
TC-02	Submit a valid lost-item report with no image.	Report is created with status lost; a success toast appears.	[Record after live test]	Not yet executed
TC-03	Submit a valid found-item report with a PNG/JPEG/WebP image below 4 MB.	Image is stored, report is created with status found, and a success toast appears.	[Record after live test]	Not yet executed
TC-04	Submit an invalid image type or a file above 4 MB.	Submission is blocked and an error toast appears.	[Record after live test]	Not yet executed
TC-05	Filter and paginate the public browse directory.	Only matching reports are displayed and empty states are clear.	[Record after live test]	Not yet executed
TC-06	View a found report as a student without an approved claim.	Reporter contact details are hidden.	[Record after live test]	Not yet executed

ID	Test case	Expected result	Actual result		Status	
TC-07	Submit an ownership claim with at least 20 characters of proof.	One pending claim is stored and a success toast appears.	[Record live test]	after	Not executed	yet
TC-08	Attempt a second claim for the same item from the same student.	Duplicate claim is blocked with an explanatory toast.	[Record live test]	after	Not executed	yet
TC-09	Sign in as an admin and approve a pending claim.	Claim becomes approved, the claimant receives an in-app notification, and contact details become visible only to that claimant/admin.	[Record live test]	after	Not executed	yet
TC-10	Reject a pending claim with an optional note.	Claim becomes rejected and the claimant receives an in-app notification and note.	[Record live test]	after	Not executed	yet
TC-11	Set each allowed item status.	Only lost, found, resolved, and archived can be selected.	[Record live test]	after	Not executed	yet
TC-12	Attempt direct admin access as a student.	Server rejects the request with a forbidden response.	[Record live test]	after	Not executed	yet

1.5 Defects and Corrective Actions

During browser inspection, a duplicate React navigation key warning was observed in the initial administrator sidebar. The duplicate menu entry was removed, then TypeScript, automated tests, production build, and responsive previews were re-run. No unresolved build or type-check defects remain in the development environment.

1.6 Test Conclusion

The implemented rules and access controls have automated evidence, the production build passes, and key responsive states have been visually inspected. Before submission, the student must complete the live manual checklist above using separate student and admin accounts and replace the “Not yet executed” entries with observed results.
